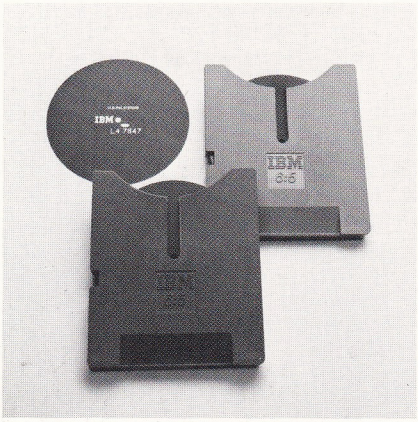
6:5 Cartridge System

Dial System

The IBM 6:5 Dial System turns an ordinary dial telephone into a personal input processing unit.



6 Minutes.

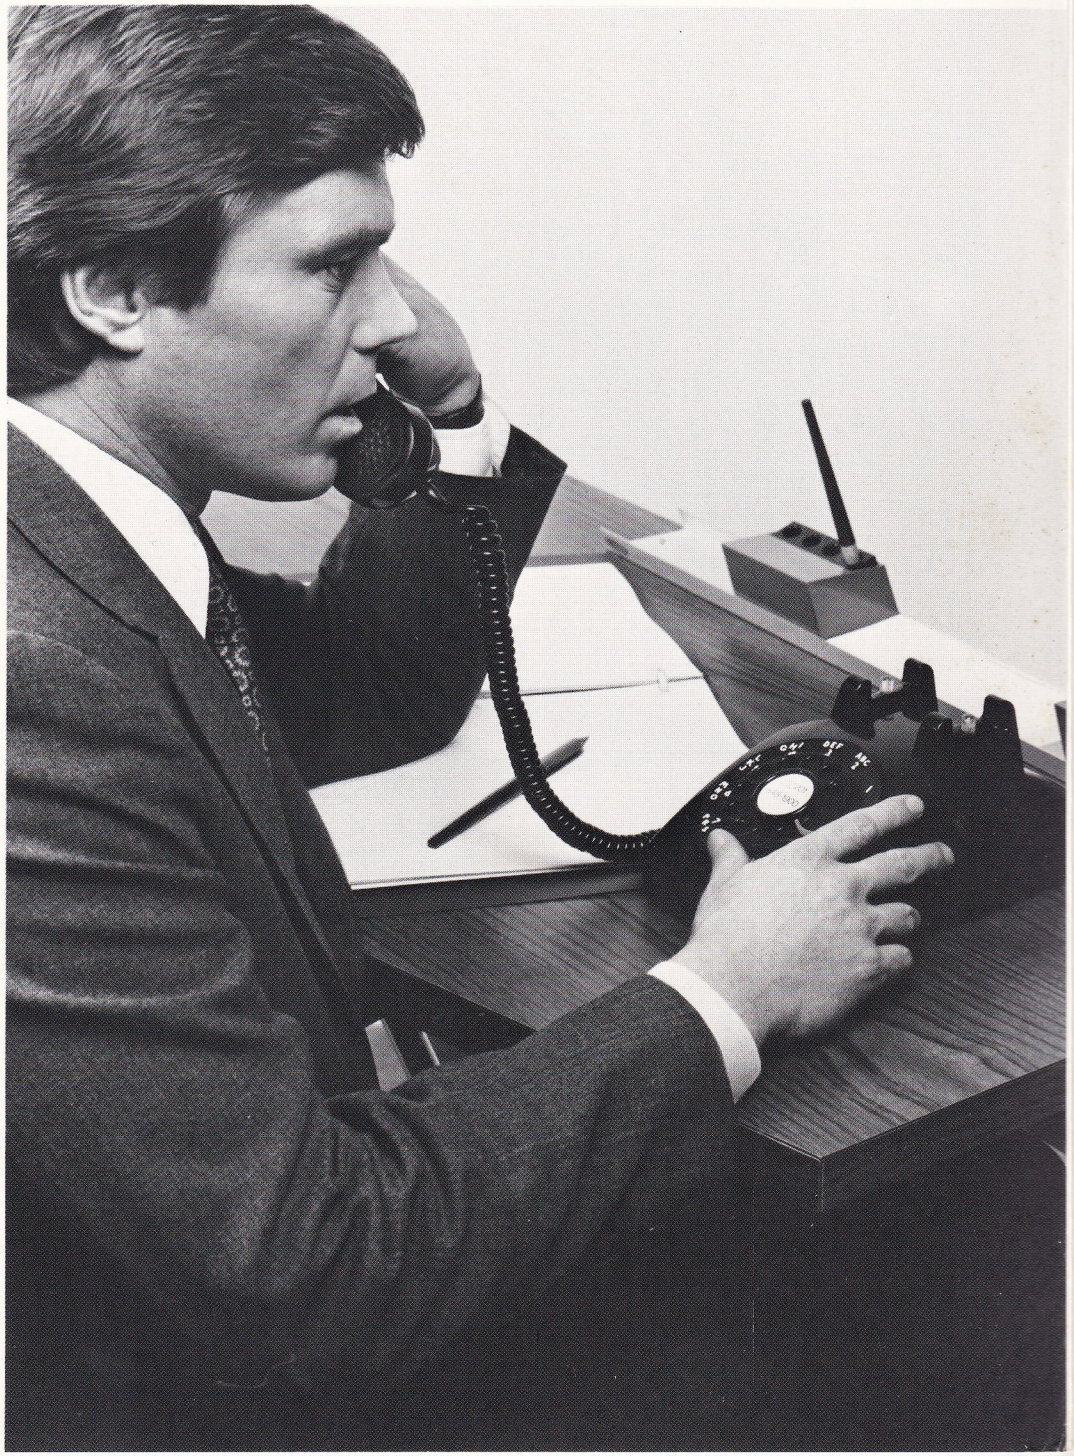
The medium used in the IBM 6:5 Cartridge System is a 3¼-inch magnetic disc. Each disc gives 6 minutes of recording time (the equivalent of about 2 typewritten pages). For easy handling, up to 25 IBM 6:5 Mag Discs are contained in one compact cartridge.

5 Hours.

The IBM 6:5 Recorder accepts two full cartridges, providing as much as 5 hours of recording time. The cartridges are color-coded to facilitate fast identification of assignments, rush jobs and confidential transcriptions.

Simple Operation.

Simply by dialing a code on the telephone dial, you can record, stop, listen, review and give special instructions. You can also eject the recorded disc and the machine will automatically position a new disc for recording.



A modular system that easily adapts and changes to your growing and varying needs.

As part of the IBM 6:5 Cartridge System, the IBM 6:5 Dial System can adapt to numerous kinds of situations. This means you can expand its use to keep pace with your needs. Why is this possible? Because the IBM 6:5 Cartridge System is modular. You can add to it, at your own rate, whenever your input processing needs increase. Simply put, modularity means adaptability.

The secretary can transcribe your dictation quickly and efficiently.

The IBM 6:5 Transcriber has been engineered to allow the secretary to transcribe your dictation with maximum ease and speed. Convenient, fast, efficient—what you would expect of a modern input processing system.

Distribution is simple.

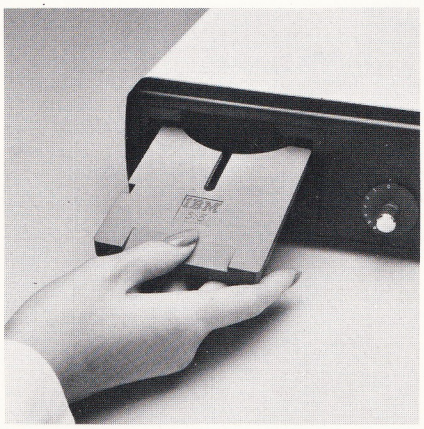
Since cartridges are easily handled, the distribution of work, especially crucial at peak periods, is greatly enhanced. Also, easy distribution of assignments provides effective support to your work routine. It is a better way for both you and the secretary to get the job done.

Flexibility.

Here is a system that offers long recording time, minimum media handling, and good audio reproduction. And, whatever your input processing needs—today and tomorrow—here is a system that offers a segmented, reusable medium for handling the growing input processing requirements of your office.

The IBM 6:5 Dial System

Discs are easy to file.
Because magnetic discs are small and pliable, they can be attached to a particular document for distribution, filing, storage, even mailing. Plus, a recorded disc can serve as a permanent record or reference for playback without transcription.



Transcription is easy.
All the secretary has to do is snap a completed cartridge into the IBM 6:5 Transcriber and begin. Separate volume, tone and speed controls, at hand's reach, allow the secretary to individually adjust the sound and the rate of the playback. The secretary, then, can transcribe the dictation both comfortably and easily.

Color-coding helps, too.
When the work load is heavy, cartridges can be passed to other typists who have IBM 6:5 Transcribing units. And since each cartridge is color-coded, each job is quickly identified according to the individual method established in the office.

Installation: Contact your local telephone company to order and install the required telephone company equipment. IBM Customer Engineering will test the system after installation is completed.
Specifications: Model #288. Operates on 60 Hertz, 110 volt current. The IBM 6:5 Dial System consists of a 6:5 Recorder and a Dial Control Box. Each 6:5 Recorder and Control Box is 12" wide, 11½" deep, 3¾" high. Recorder weight is 12 pounds. Control Box weight is 4 pounds. Available only with pearl white case and a black front panel.
